## Life Cycle of a Plant

Living things have **life cycles**.

1. The life cycle of a plant begins with an embryo. An embryo comes from a fertilized egg. The egg cells of a seed plant develop in its flowers.
2. The seed sprouts.
3. A seedling grows.
4. The plant develops into an adult plant.
5. The adult plant produces flowers.
6. Inside the flower, new egg cells develop.

In the boxes below, draw pictures of the life cycle of a plant. You may use an encyclopedia to help you.
